## Introduction

Interleukin-15 has been identified as a promising candidate for use as an immuno-oncology therapeutic, but the native cytokine has poor drug-like properties. NKTR-255 is a novel immunotherapeutic agent consisting of polymer-engineered IL-15 designed to optimally engage the IL-15 receptor complex and provide durable pathway activation *in vivo*. Here we show that NKTR-255 has greatly improved plasma and tumor exposure relative to IL-15, induces NK and CD8 T-cell activation and proliferation, and has single-agent efficacy in syngeneic tumor models.

## Methods

Binding kinetics and affinity of NKTR-255 for IL-15Ra were measured by surface plasmon resonance using immobilized IL-15Ra. Cell-based potency was determined by treating CTLL-2 cells with NKTR-255 at a range of concentrations and measuring phosphorylation of STAT5 in cell lysate by immunoassay. Pharmacokinetic analysis was performed following single-dose intravenous administration of IL-15 and NKTR-255 in normal mice and in mice bearing subcutaneous B16F10 and CT-26 tumors, with analytes quantified in tumor and plasma by ELISA. Immunophenotyping studies were performed by flow cytometry on lymphocytes from peripheral blood of NKTR-255-treated and IL-15-treated normal mice and from spleen, tumor, and draining lymph node of treated mice carrying subcutaneous TRAMP-C2 tumors. Efficacy was determined by measuring tumor volume of subcutaneous TRAMP-C2 and CT-26, with q5dx3 treatment with NKTR-255.

## Results

NKTR-255 binds to IL-15Ra, and induces STAT5 phosphorylation in CTLL-2 cells with subnanomolar EC<sub>50</sub>. Following intravenous administration, NKTR-255 demonstrates a greatly reduced clearance rate compared to IL-15, with plasma t<sub>1/2</sub> of 22-26h versus <1h for IL-15. Tumor exposure of NKTR-255 was 50-fold greater than IL-15 in B16F10-bearing C57/Bl6 mice and 110-fold greater in CT-26-bearing Balb/c mice. Immunophenotyping studies in normal mice showed an induction of Ki-67 and CD122 expression in NK cells, indicating proliferation and activation. In tumor-bearing mice, NKTR-255 treatment resulted in an increased CD8:CD4 and CD8:Treg ratio in tumor and spleen, and an increased frequency of CD8+TNF+IFNγ+ T-cells. Tumor growth inhibition was observed in both CT-26 and TRAMP-C2 models.

## Results

### NKTR-255 binds to IL-15Ra

| Analyte  | k <sub>on</sub> (M <sup>-1</sup> s <sup>-1</sup> ) | k <sub>off</sub> (s <sup>-1</sup> ) | K <sub>D</sub> (nM) |
|----------|--|-------------------------------------|---------------------|
| IL-15    | 5.78x10 <sup>5</sup>                               | 1.49 x 10 <sup>-4</sup>             | 0.26                |
| NKTR-255 | 8.29x10 <sup>4</sup>                               | 1.62 x 10 <sup>-4</sup>             | 1.96                |

- Retention of binding to IL-15Ra is an important determinant of the biological activity of NKTR-255
- Surface Plasmon Resonance was used to determine the binding kinetics and affinity of NKTR-255 for IL-15Ra

### NKTR-255 is bioactive, with sub-nanomolar EC<sub>50</sub>

| Test Article | EC <sub>50</sub> (ng/ml) | EC <sub>50</sub> (pM) |
|--------------|--------------------------|-----------------------|
| IL-15        | 0.27                     | 21                    |
| NKTR-255     | 5.6                      | 430                   |

CTLL-2 cells were treated with test article for 10 minutes, then cells lysed and STAT5 phosphorylation assessed using a MesoScaleDevice immunoassay.

### Compared to IL-15, NKTR-255 has greatly improved plasma and tumor exposure

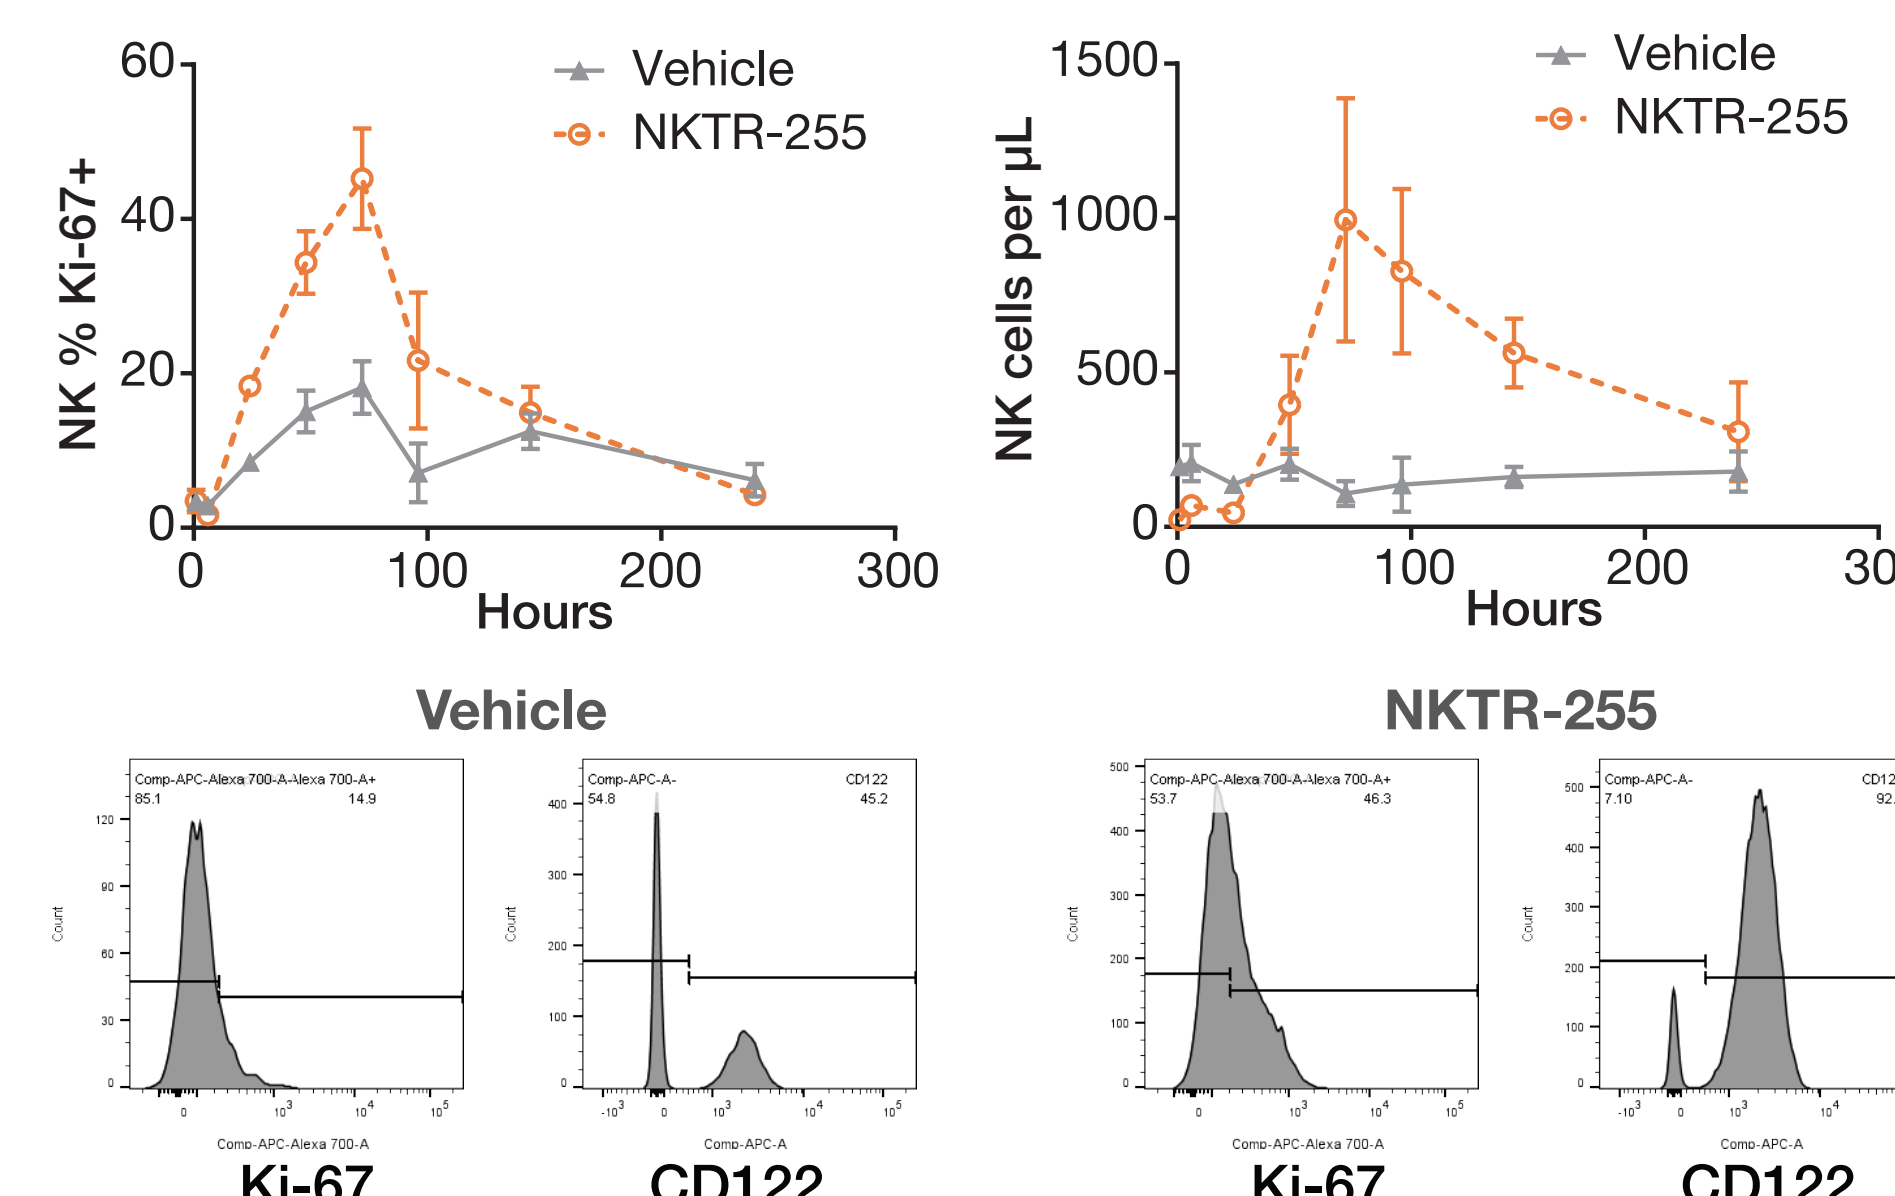

Pharmacokinetic data are shown for IL-15 and two PEG-IL-15 conjugates with linkers tuned to provide different PEG release kinetics. All were administered i.v. at 0.5 mg/kg.

- Unmodified IL-15 is cleared rapidly, so frequent administration of a high dose is required to achieve therapeutically relevant exposure
- NKTR-255 achieves >100x greater tumor exposure for the same dose

### NKTR-255 induces NK cell proliferation and activation

A single i.v. dose of NKTR-255 induces expression of proliferation marker Ki-67 on NK cells peaking at 72hr, with a corresponding increase in frequency of NK cells in blood. Expression of NK activation marker CD122 was also increased – histograms shows 72 hour timepoint.

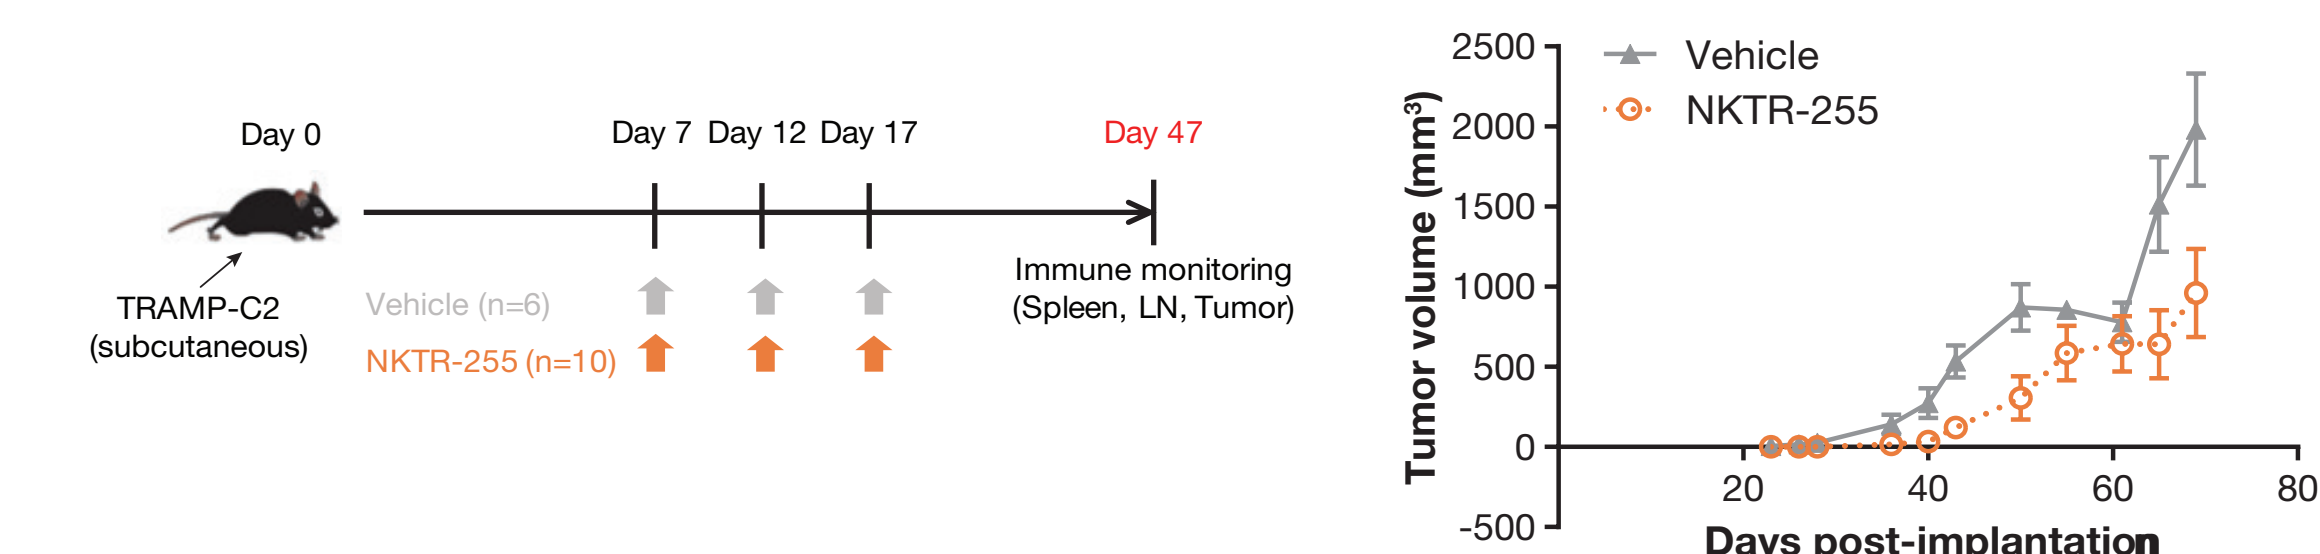

### NKTR-255 induces sustained signaling in lymphocytes *in vivo*

Mice received a single i.v. dose of 0.3 mg/kg NKTR-255 (left) or IL-15 (right), then STAT5 phosphorylation in lymphocyte subpopulations from whole blood was assessed by flow cytometry.

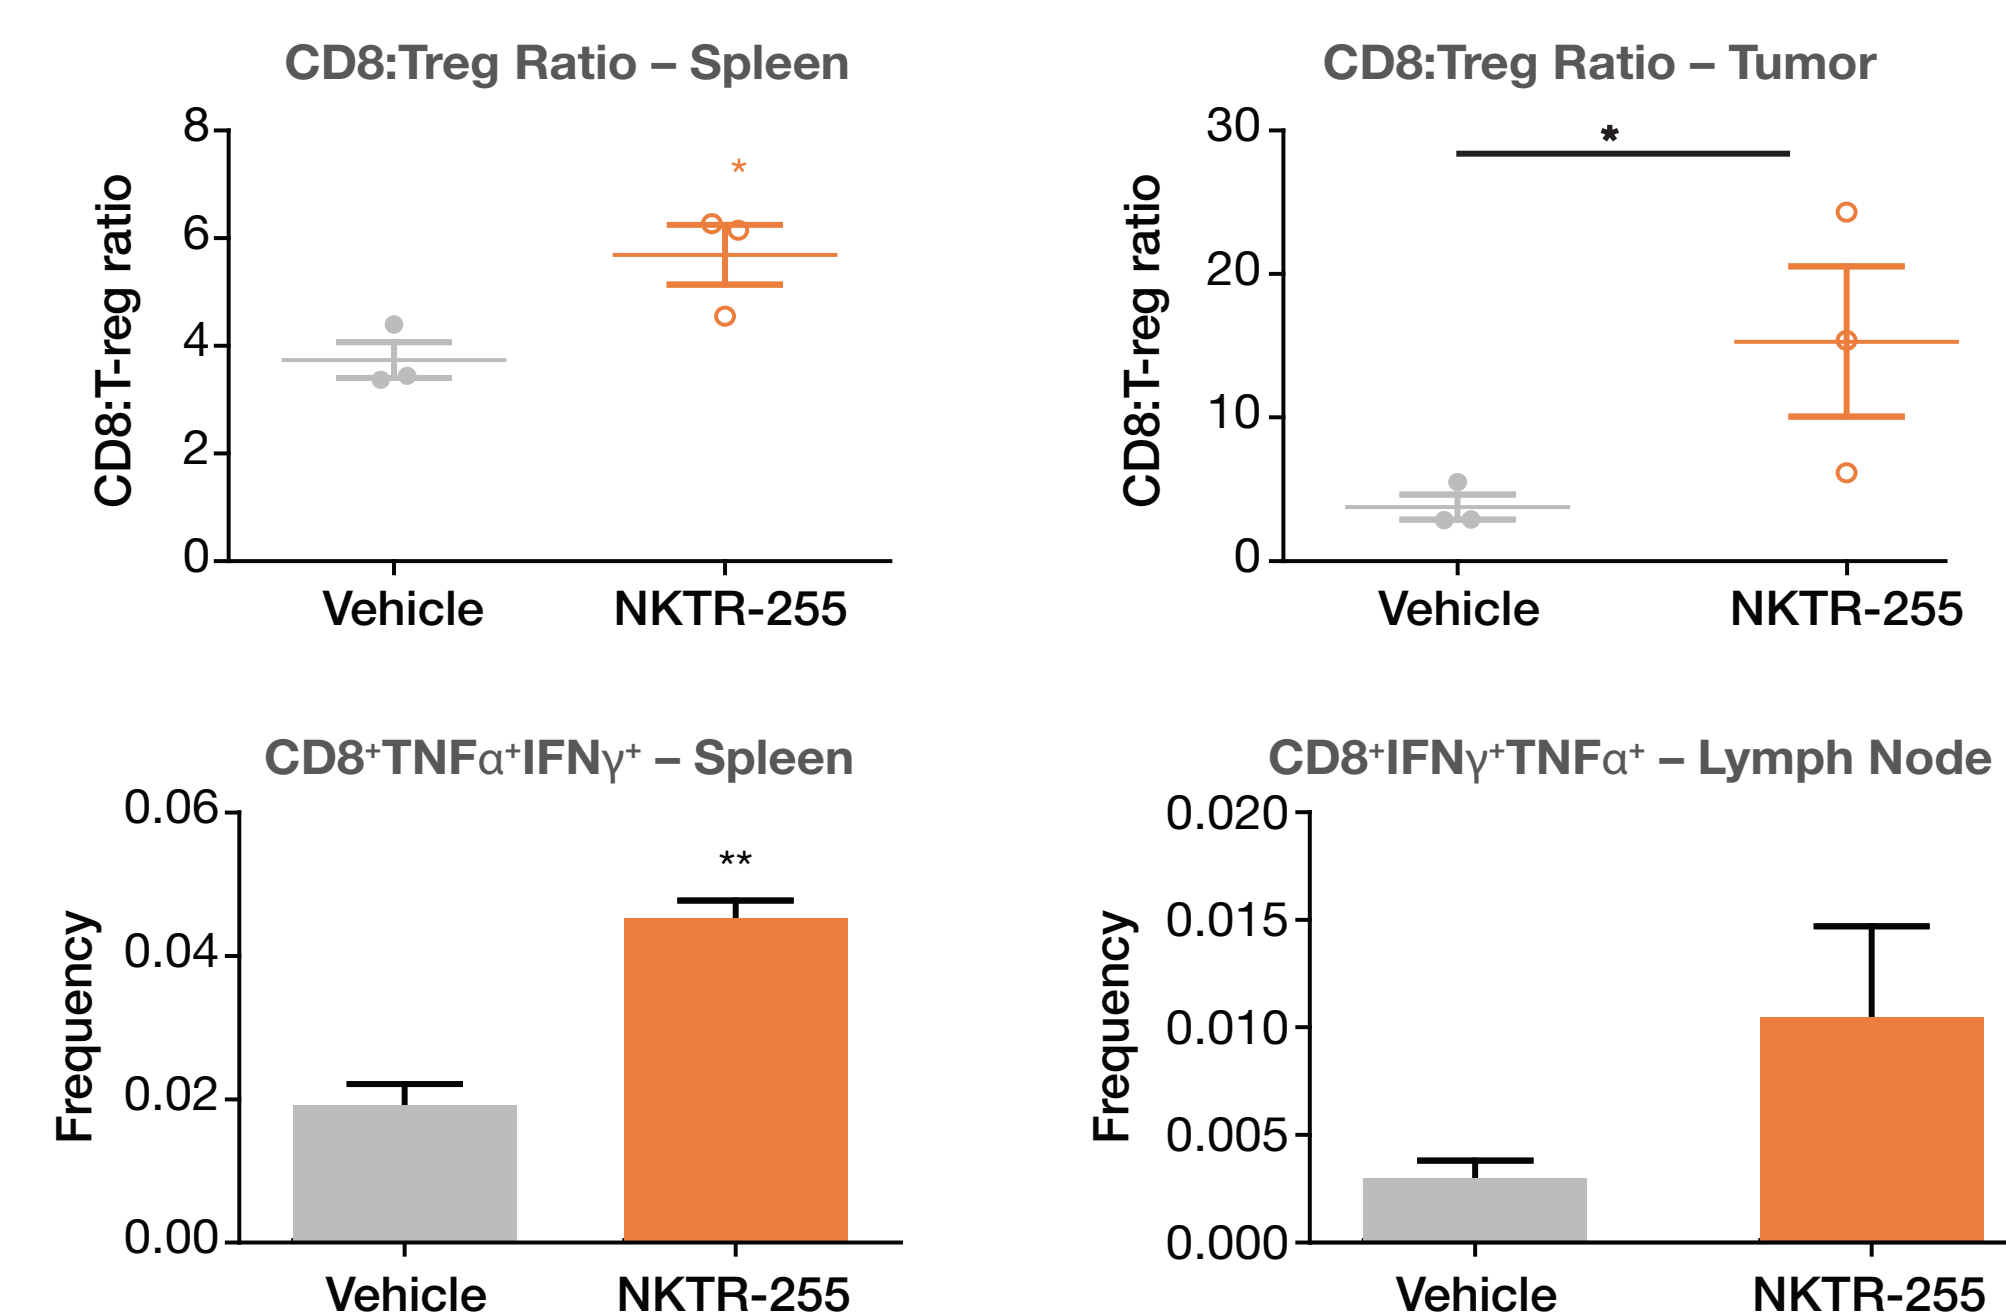

- Signaling induced by IL-15 is gone by 6 hours
- NKTR-255 sustains signal in NK and CD8 cells for more than 3 days

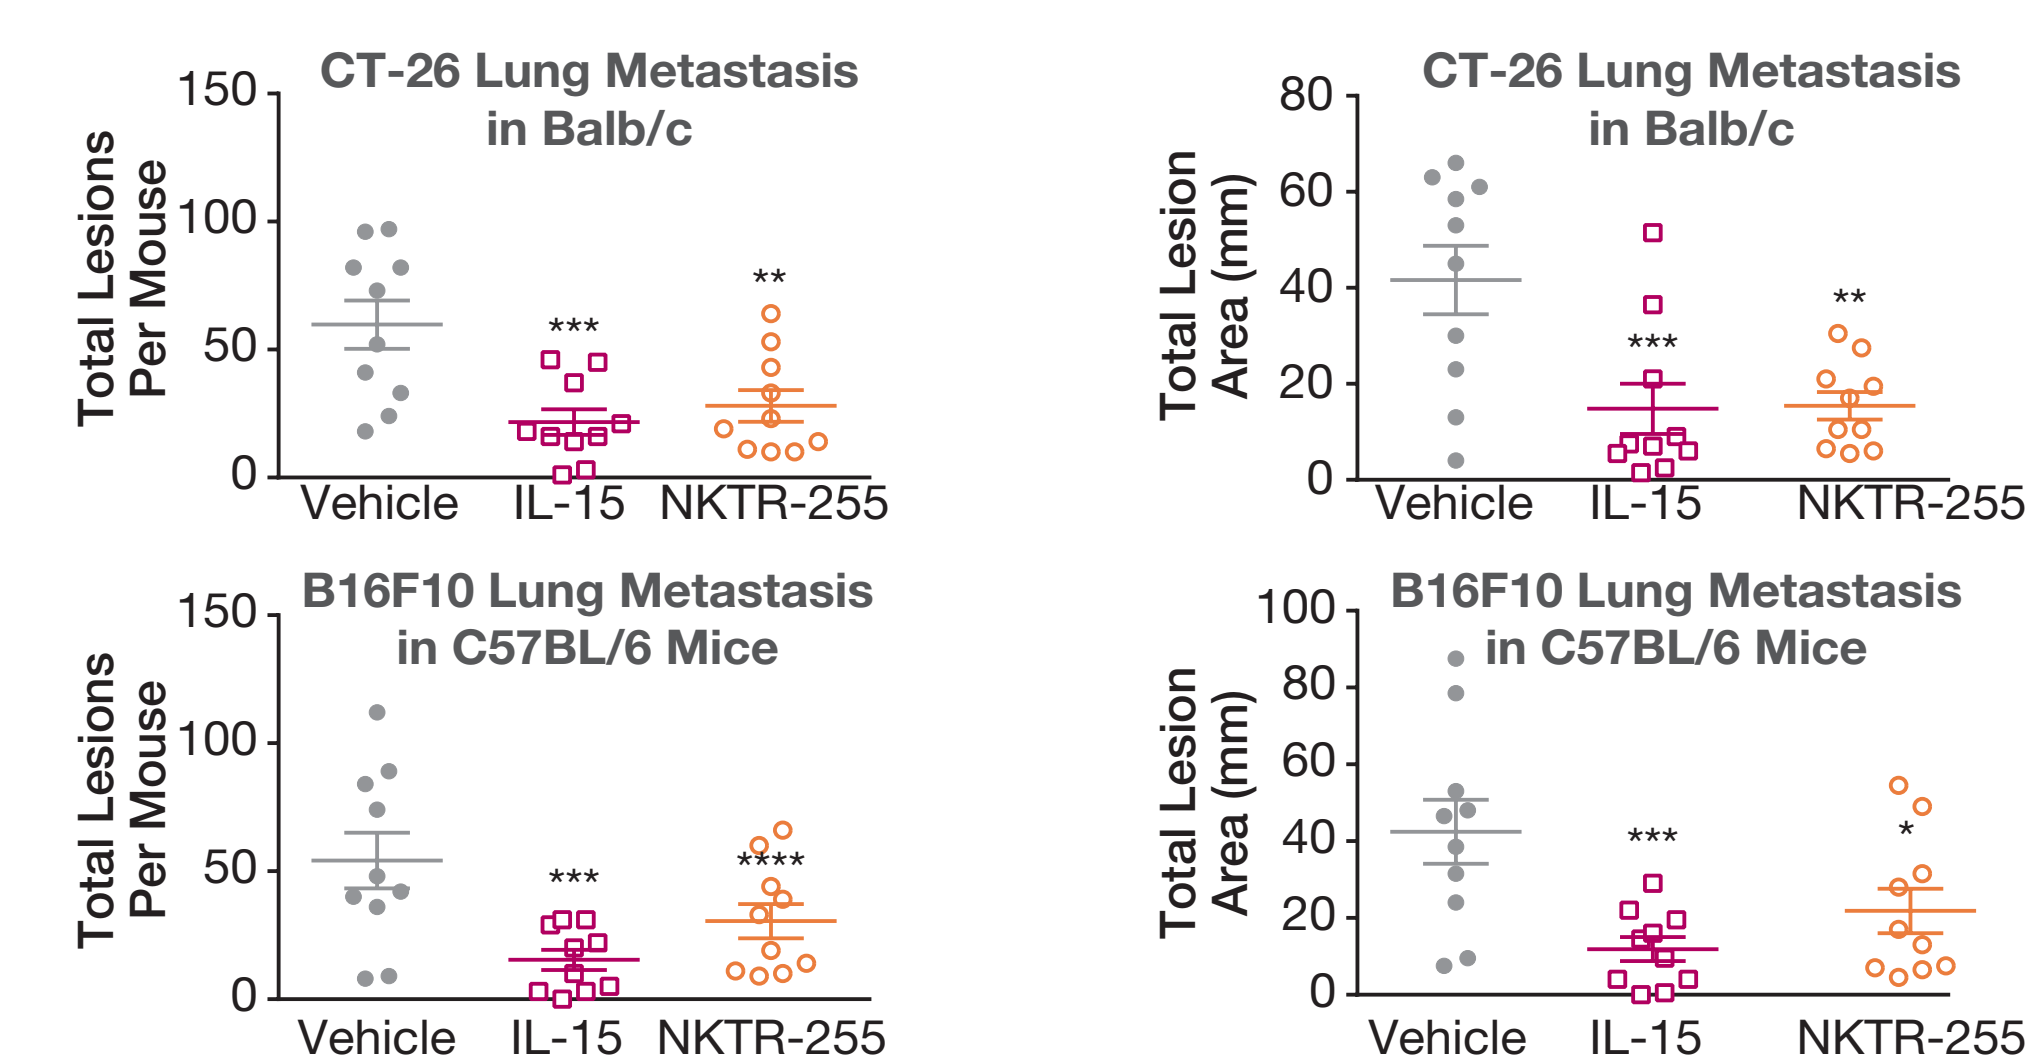

### Immunophenotypic changes induced by NKTR-255 in tumor-bearing mice

NKTR-255 treatment results in reduced tumor growth rate, an increase in the CD8:Treg ratio in spleen and tumor, and an increase in the frequency of IFNγ<sup>+</sup>/TNF<sup>+</sup> CD8 T-cells

### NKTR-255 reduces tumor burden in CT-26 and B16F10 lung metastasis models

Tumors injected i.v. on day 0. NKTR-255 dosed i.v. at 0.3 mg/kg on d1, 5, 10; IL-15 dosed at 0.3 mg/kg i.p. on d1,2,3,4,5,8,9,10,11,12. Metastases counted on d13

## Discussion

NKTR-255 treatment results in sustained IL-15 activity, which induces CD8 T-cell and NK cell activation and proliferation, and produces long-lived immunophenotypic changes in tumor-bearing mice. The design of NKTR-255 enables a potential drug-like therapeutic strategy for accessing IL-15-based immunotherapy.
